PROJECT UPDATE · 10 NOVEMBER 2026

Local Muslim

An iOS app for masjid prayer times: progress, next steps and decisions

Waqar Qureshi · Senior iOS Engineer

STATUS

Eight of nine phases are complete

8 / 9
phases delivered and committed

217
automated tests

159
Swift source files

iOS 26
Swift 6.2, strict concurrency

Phase 9, hardening and release, is under way: background refresh and the privacy manifest are done. The code was also refreshed to our AGENTS.md coding guide.

THE PRODUCT

Two audiences, one app

Worshippers · guest or account

- Find verified masjids nearby, on a list or a map
- Today’s adhan and iqamah, with a next-prayer countdown
- Favorites saved on the phone, so they work offline
- Prayer alerts at adhan and iqamah time

Masjid admins

- Register a masjid; it goes live once verified
- Enter times by hand and copy them across days
- Photograph the printed timetable; the phone reads it
- Calculated times fill any day not published

DELIVERED

What each phase delivered

#	Phase	Outcome
1	Scaffold	Xcode project, MVVM-C architecture, Firebase connected
2	Prayer time engine	Calculator checked against an astronomical reference, within 5 seconds
3	Accounts	Email sign-in, guest mode, worshipper and masjid-admin roles
4	Masjid admin	Register a masjid, enter and publish prayer times
5	Nearby	Location search, masjid page, today’s times and next prayer
6	Offline favorites	Saved masjids and 30 days of times stored on the phone
7	Timetable scan	Photo to on-device text recognition to review to publish
8	Prayer alerts	Local notifications, chosen per prayer and per masjid

ENGINEERING QUALITY

Brought up to the AGENTS.md coding guide

Platform

- iOS 26 minimum
- Swift 6 strict concurrency
- Warnings fail the build
- Deprecated APIs removed

Structure

- Folders by feature
- One type per file
- Screens built from small views
- Display logic in view models

Reliability

- async/await for Firebase and Maps
- Works offline, syncs on reconnect
- 217 automated tests
- Every step built and tested

NEXT · PHASE 9

Hardening the app for release

Done

- **Background refresh:** alerts stay current without opening the app
- **Privacy manifest:** the data declaration App Review requires

Up next

- Tapping an alert opens that masjid
- Automated tests for the server’s security rules
- Accessibility: VoiceOver and large text on every screen
- Crash reporting (decision needed)

RELEASE PLAN

The path to the App Store

1

Finish Phase 9

Remaining hardening items

[date]

2

Device testing

Real phones against the live Firebase project

[date]

3

TestFlight

Beta with [N] local masjids and their communities

[date]

4

Store listing

Icon, screenshots, privacy labels

[date]

5

Launch

App Review, then release

[date]

FOR DISCUSSION

Decisions I'd like your input on

Crash reporting

Apple's MetricKit (no new dependency, reports arrive daily) or Firebase Crashlytics (live dashboard, adds an SDK)?

Approving masjids

Approve by hand in the Firebase console for the beta, or build an admin page with a Cloud Function now?

Minimum iOS version

The app now needs iOS 26, per AGENTS.md. Confirm we accept losing users on older iPhones.

Beta and launch

Which masjids join the TestFlight beta, and what launch date are we aiming for?
